RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 58 pages. Original publisher: Seattle, Wash. : U. S. Dept. of Commerce, National Oceanic and Atmospheric Administration, Alaska Fisheries Science Center ; Springfield, VA : Available from the National Technical Information Service, 1994 OCLC Number: (OCoLC)535500776 Subject: Drift net fishing -- Environmental aspects -- North Pacific Ocean. Excerpt: . . . 5 Using the logit function, and fitting a linear predictor composed of a p-dimensional vector of independent variables (X, X, . . . , X), leads to the 1 2 p familiar logistic regression model where the conditional probability of salmonid incidence is-given as The independent variables used in the analyses consisted of spatial factors (latitude and longitude), month, time period, and sea surface temperature. Model parameters B of the i linear predictor were estimated by the method of maximum likelihood. Model selection employed a stepwise regression algorithm. Design variables for categorical variables were constructed using reference cell coding, where the lowest group of a categorical variable serves as a referent group (Table 3). Model significance was assessed by likelihood ratio statistics which are formed from the logarithm of the ratio of two likelihoods (hereafter called the deviance). For a particular step, the deviance provides a test for whether the term entered (or removed) at that step significantly improves model prediction. Model adequacy was assessed by the Hosmer goodness-of-fit test (Hosmer and Lemeshow 1989), which compares the observed and predicted frequencies within strata defined by a grouping of the estimated probabilities. Results Only 57 of the 1, 402 (i. e. , 4. 07) observed operations encountered salmonids, of resulting in a total observed catch 79 salmonids during the 1989 monitoring program. As a...
